

New RADAC Visual Concept

NOTE: dd#'s refer to a specific design decision.
dd#2 and dd#8 apply to entire system.

New RADAC Design Decisions

1. Archive input (raw) data, output (processed) data and system history.
2. System should be of modular design.
3. All input data should enter system via front end processor.
4. Publish data to the www and to local users.
5. Handle various input data formats, including some currently undefined.
6. Compare output from “redundant” processors to calculate a confidence level.
7. Monitor the quality of input data, separate from the processing function.
8. Support simultaneous unrelated projects.
9. Include panel for manual control.
